

A composite image of the solar system. In the top left, a portion of Earth is visible. Below it is the bright orange Sun. To the right of the Sun is the Moon. Further right is Mars. In the bottom right is Jupiter. A comet is streaking across the upper right, and a galaxy is visible in the top right corner.

Weather

Water &
Energy
Cycle

How is the Earth changing and what are the consequences of life on Earth?

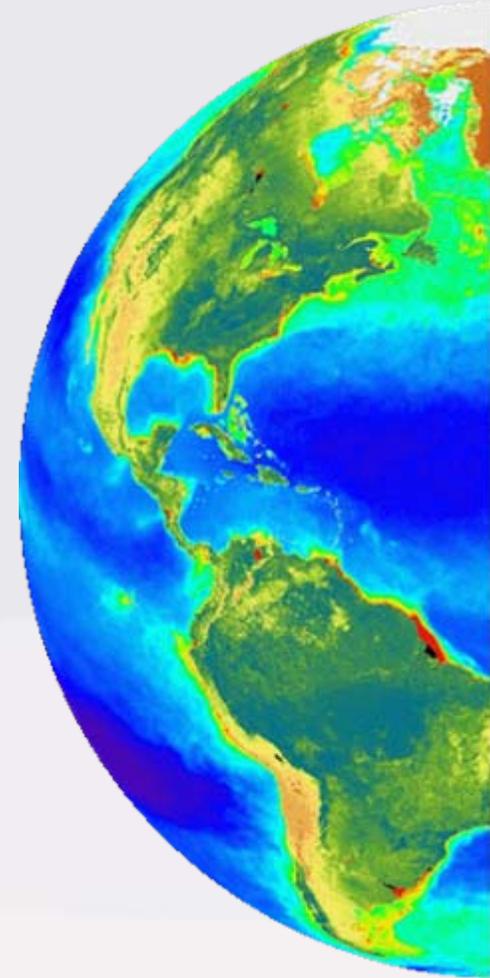

How is the global Earth system *changing*?

What are the primary **forcings** of the Earth system?

How does the Earth system *respond* to natural and human-induced changes?

What are the *consequences* of changes in the Earth system for human civilization?

How well can we *predict* future changes in the Earth system?

Science Questions and Focus Areas

Variability

Precipitation, evaporation & cycling of water changing?

Global ocean circulation varying?

Global ecosystems changing?

Atmospheric composition changing?

Ice cover mass changing?

Earth surface transformation?

Forcing

Atmospheric constituents & solar radiation on climate?

Changes in land cover & land use?

Motions of the Earth & Earth's interior?

Climate Variability and Change
Carbon Cycle and Ecosystems
Water and Energy Cycle

Response

Clouds & surface hydrological processes on climate?

Ecosystems, land cover & biogeochemical cycles?

Changes in global ocean circulation?

Atmospheric trace constituents responses?

Sea level affected by Earth system change?

Atmospheric Composition
Weather
Earth Surface and Interior

Consequence

Weather variation related to climate variation?

Consequences of land cover & land use change?

Coastal region impacts?

Regional air quality impacts?

Prediction

Weather forecasting improvement?

Improve prediction of climate variability & change?

Ozone, climate & air quality impacts of atmospheric composition?

Carbon cycle & ecosystem change?

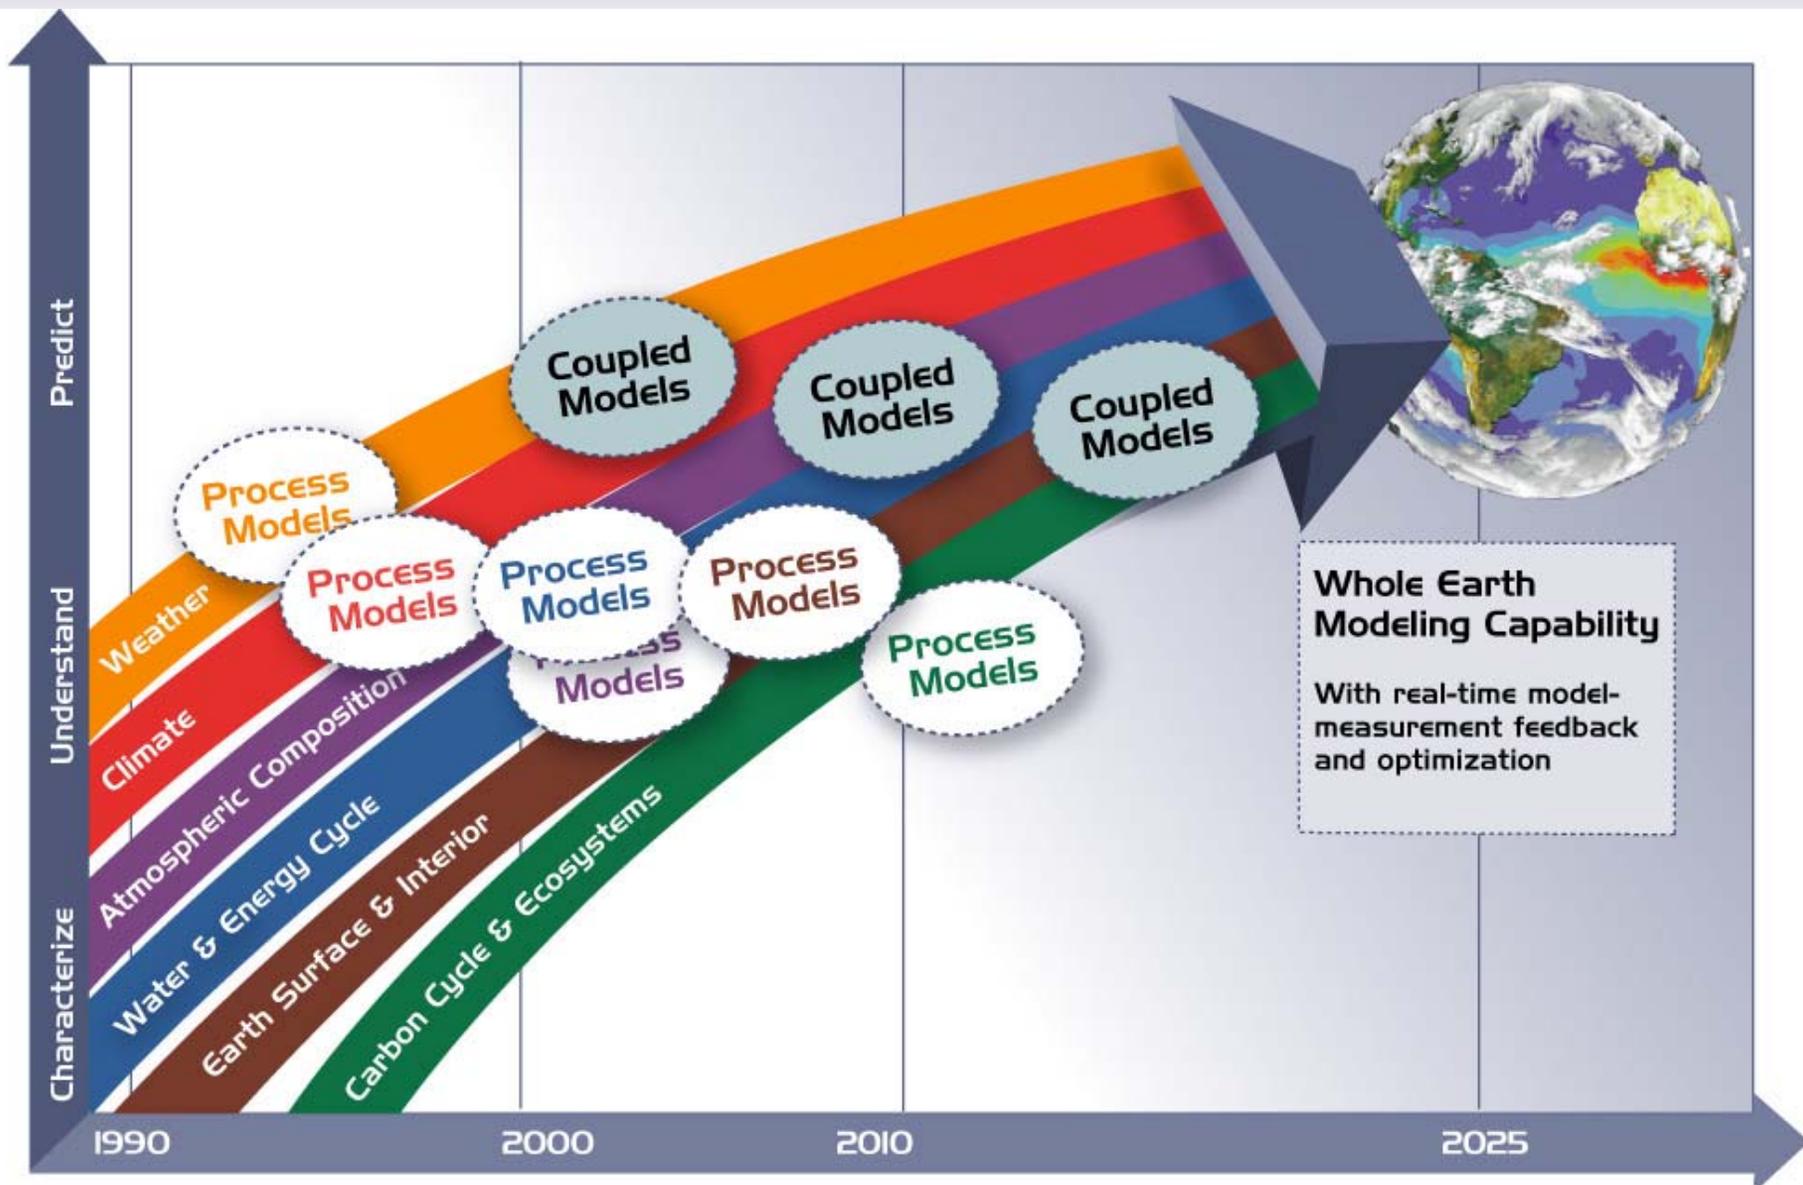

Change in water cycle dynamics?

Predict & mitigate natural hazards from Earth surface change?

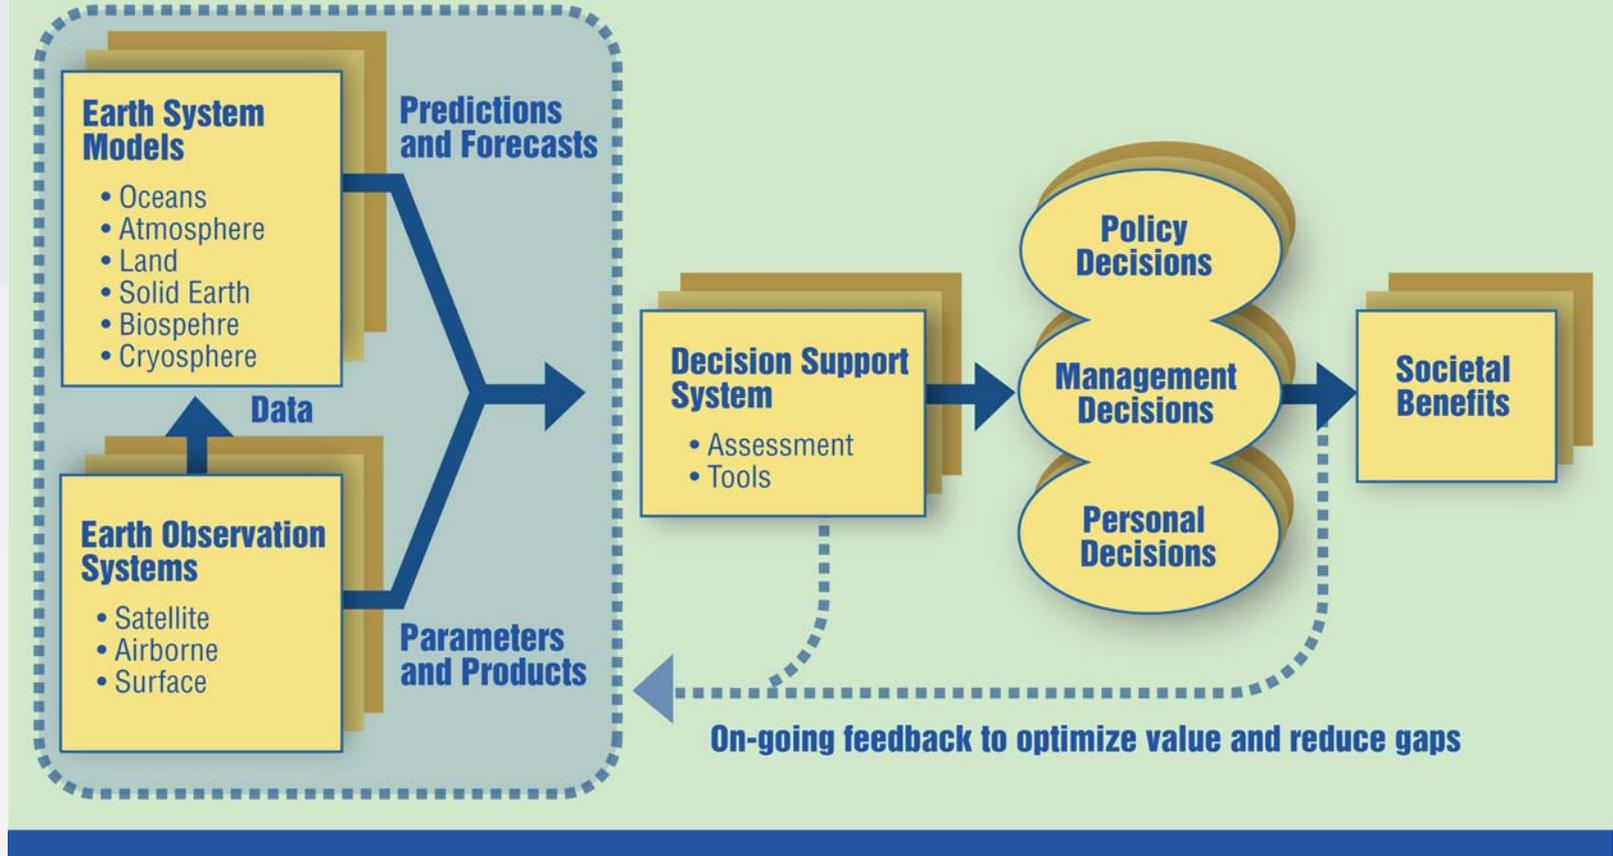

Focus Area Integration via Earth System Modeling

Integrating Knowledge, Capacity and Systems into Solutions

Near-Term Opportunities

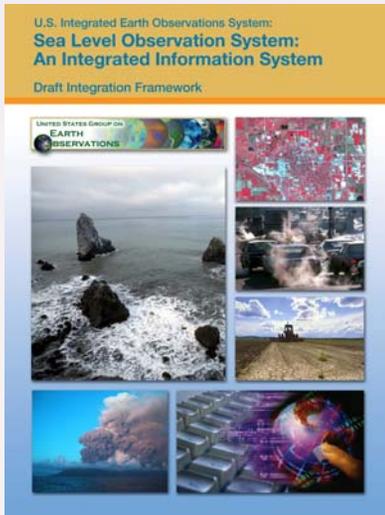

A. Data Management

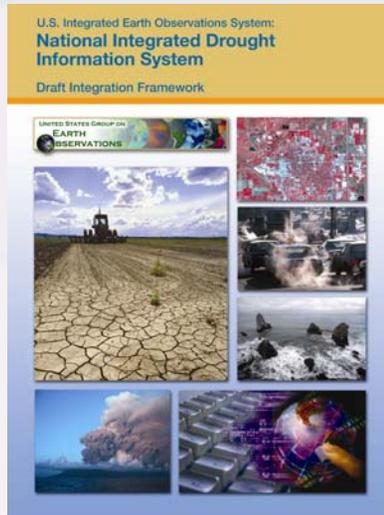

B. Disaster Warnings

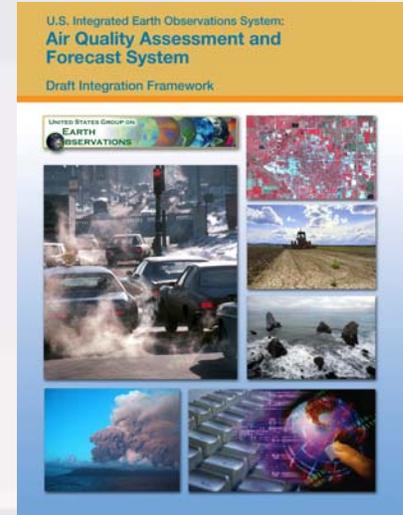

C. Global Land System

D. Sea Level System

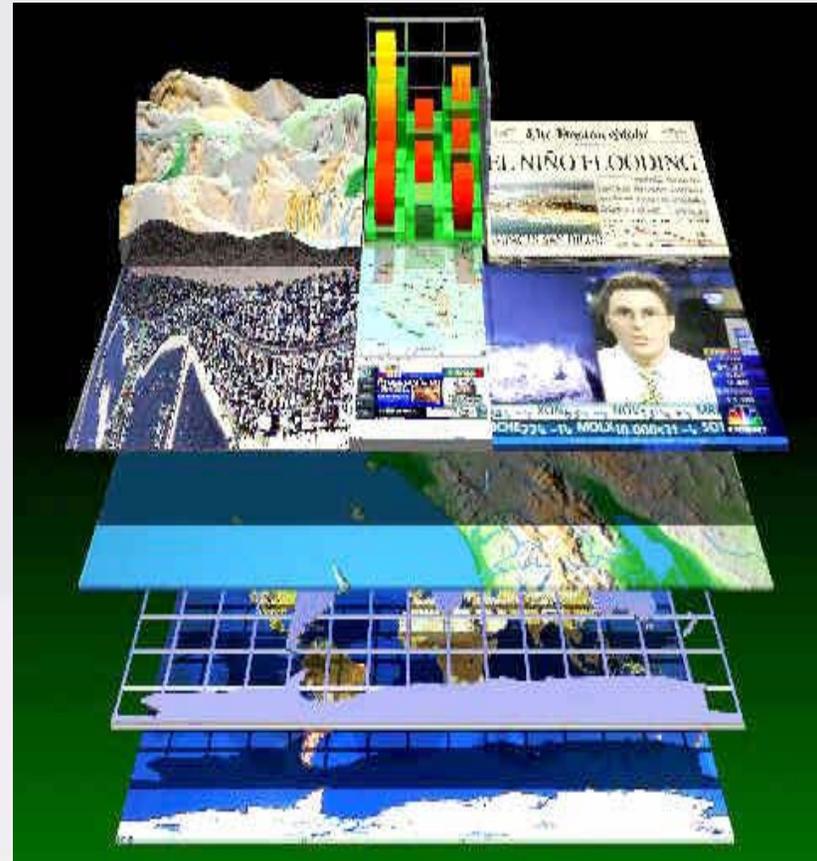

E. Drought System

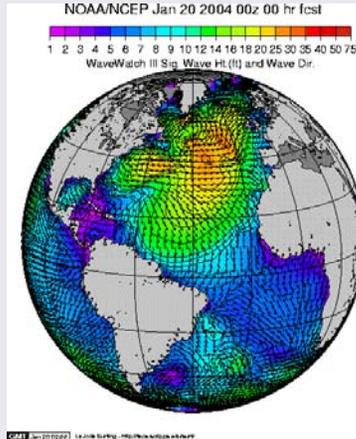

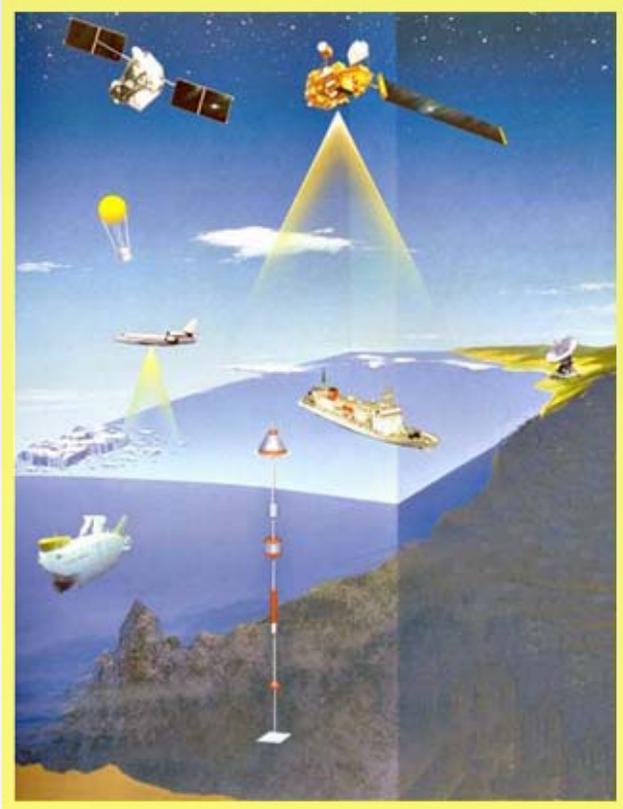

F. Air Quality System

A. Data Management System for Earth Observations

- Data Sharing
- Processing facilities
- Access and archival
- Data transfer
- Web services
- Standards and Interoperability

B. Improved Observations for Disaster Management

Data Assimilation & Modeling

Tools for Decision Makers

HAZUS^{MH}

EARTHQUAKE • WIND • FLOOD

HAZUS^{MH}

can estimate losses from earthquakes, hurricane winds, and floods.

Use GIS technology to combine hazard layers with national databases and apply a standardized loss estimation and risk assessment methodology.

Nationwide database includes datasets on demographics, building stock, essential facilities, transportation, utilities, and high-potential-loss facilities.

Visit www.fema.gov/hazus for more information.

E. National Integrated Drought Information System

U.S. Drought Monitor

May 3, 2005
Valid 8 a.m. EDT

Intensity:

- D0 Abnormally Dry
- D1 Drought - Moderate
- D2 Drought - Severe
- D3 Drought - Extreme
- D4 Drought - Exceptional

Drought Impact Types:

- Delineates dominant impacts
- A = Agricultural (crops, pastures, grasslands)
- H = Hydrological (water)
- (No type = Both impacts)

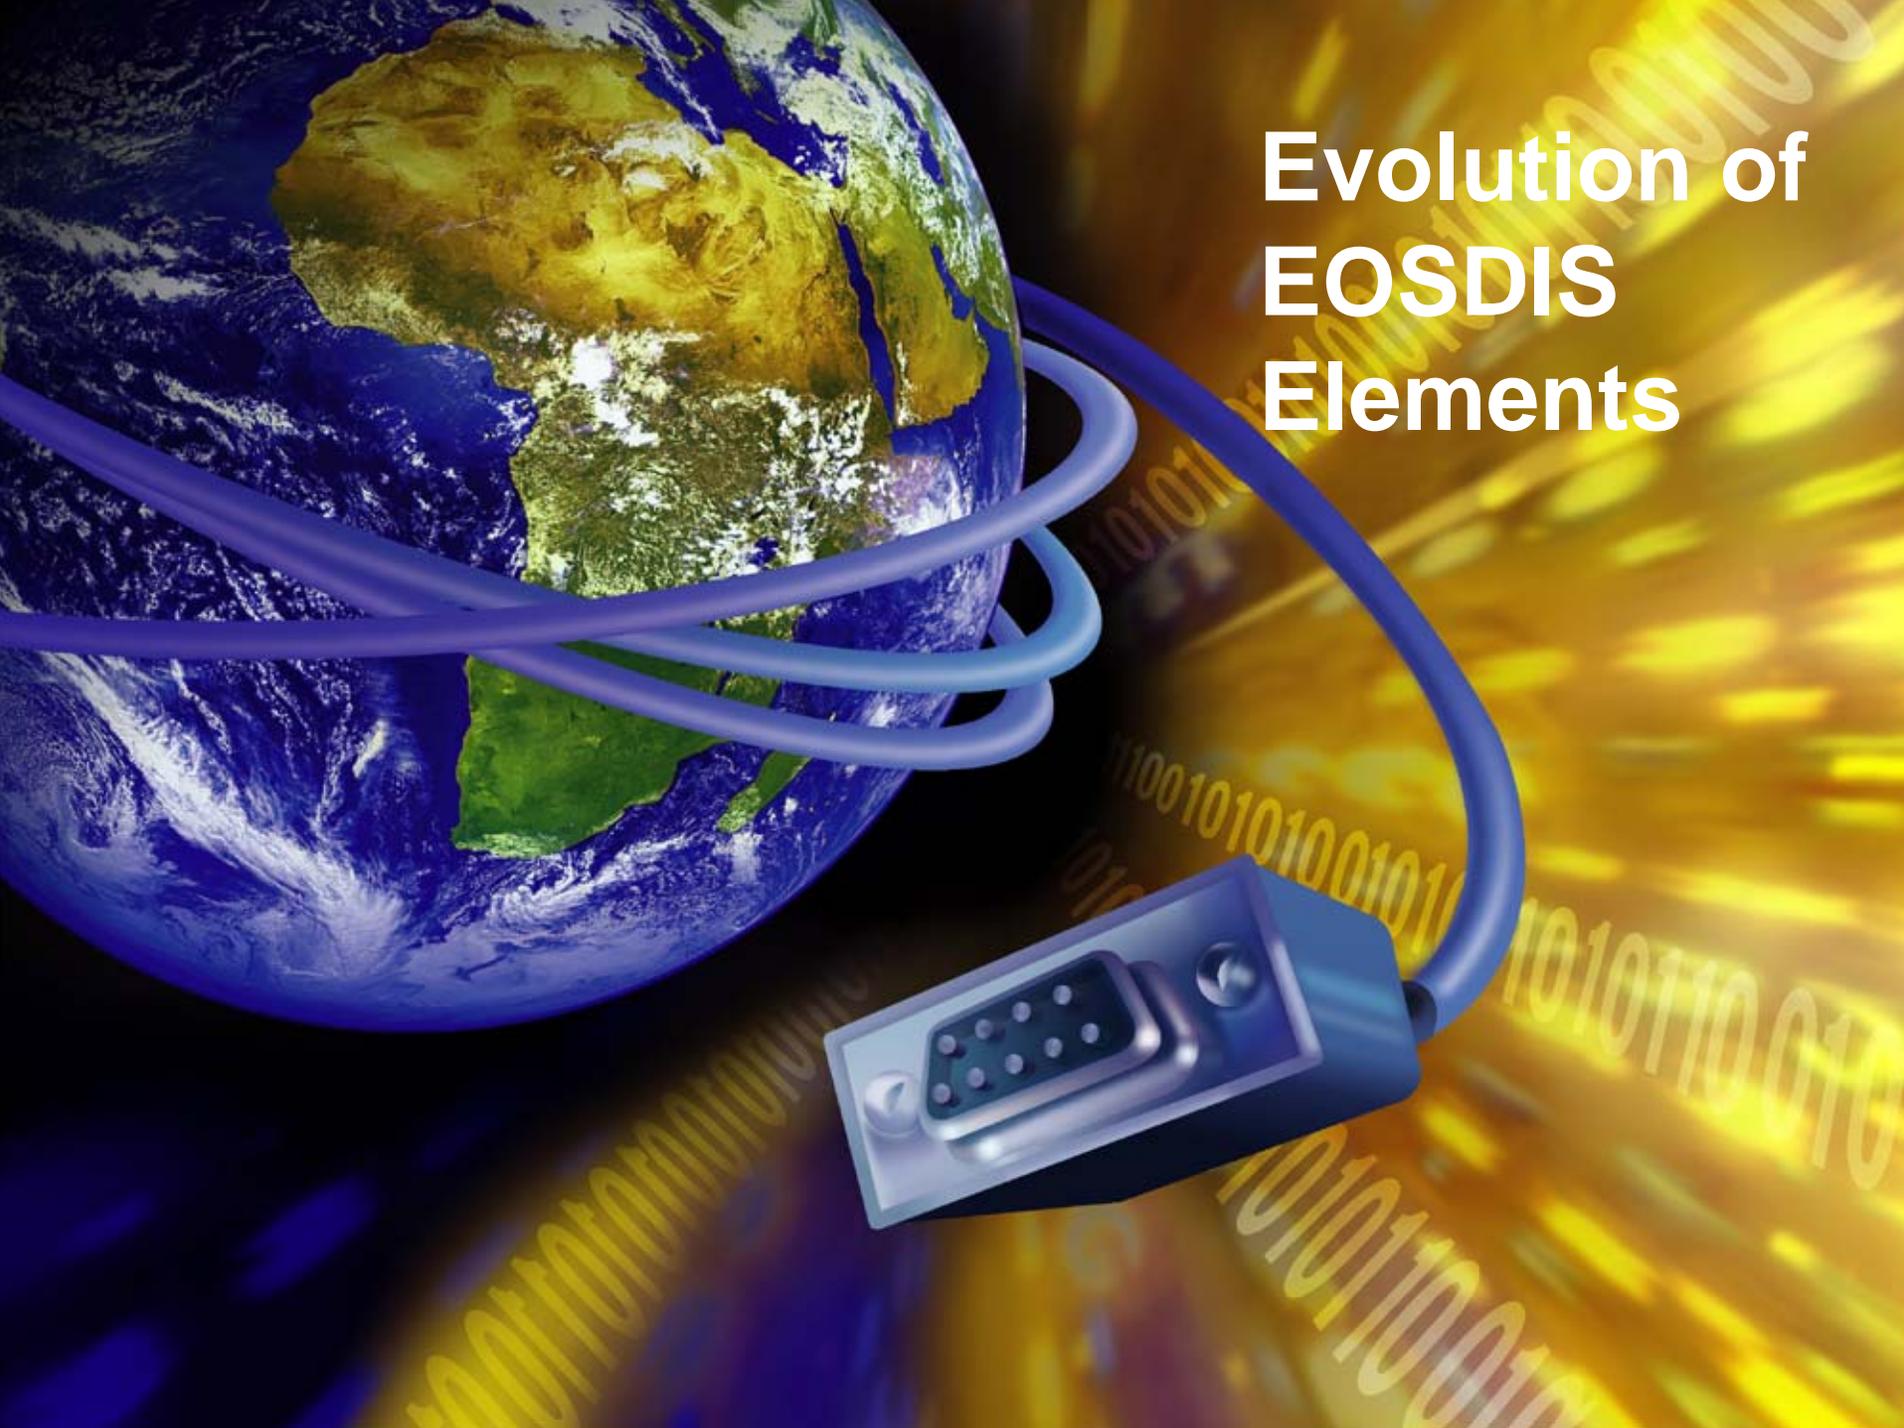

The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. See accompanying text summary for forecast statements.

Earth System Data Resides in Distributed Active Archive Centers (DAAC)

Evolution of EOSDIS Goals & Objectives

Goal: assess the current state of EOSDIS in order to identify the components that:

- can/must evolve,
- need to be replaced because of the rapid evolution of information technologies, and
- require a phase-out strategy because they are no longer needed.

This study should provide findings and options for evolution of elements of EOSDIS in order to:

- Increase end-to-end data system efficiency and operability
- Increase data usability by the science research, application, and modeling communities
- Provide services and tools needed to enable ready use of NASA's Earth science data in the next-decadal models, research results, and decision support system benchmarking
- Improve support for end users

Evolution of EOSDIS Vision 2015

NASA's research communities have access to all EOS data through services at least as rich as any contemporary science information system, for example:

- Data access latency is no longer an impediment
- The physical location of data storage is irrelevant
- Finding data is based on common search engines (e.g., Google2015)
- Services are primarily invoked by machine-to-machine interfaces
- Multiple data and metadata streams can be seamlessly combined
- Custom processing (e.g., subsetting, averaging, reprojection) provides only the data needed, the way they are needed
- Open interfaces and best practice standard protocols are universally employed

The research and value-added provider communities use EOS data interoperably with any other relevant data sources (e.g., NPOESS, METOP, GPM, numerical models, *in situ* systems) and systems (e.g., Global Earth Observation System of Systems).

The EOS archive holdings are regularly peer reviewed for scientific merit:

- Procedures for such reviews have been developed and tested over a decade
- Derived products that are not deemed scientifically useful are phased out.

Mechanisms to collect and preserve the pedigree of derived data products are readily available.

Processing and data are mobile: processing can be moved to data and/or data can be moved to processing.

NASA data systems have evolved into components that allow fine-grained control over cost drivers.

Expert knowledge is readily accessible to enable researchers to understand and use the data.

“Accelerating the realization of economic and societal benefits from NASA science, information, and technology ...”
